Smart Attendance System - Architecture & Design Document (SYNTHETIC DEMO)
Date: 2026-01-10 | Author: Arjun Mehta

1. Authentication Module
Authentication Module implementation is complete.
AuthService handles JWT token issuing, password hashing, and session validation.
Rationale: Short-lived JWT cookies simplify stateless API verification.

2. Data Persistence & Backend API

PostgreSQL was selected as the primary relational database for attendance records.

Rationale: ACID transactions prevent duplicate check-in records during peak class hours.

Riya Sharma is the owner of the Backend API.

Note on performance: we may look at caching later depending on campus load.
